

This small executable is aimed at those developers who must deliver XMLTools together with their custom application(s) to common users that might find difficult to manually install the module and setup DLL.XML configuration file.

The installer will do the following:

- Check that FSX exists in the current machine and has a valid Registry path.
- Copy XMLTools.dll into FSX's main folder.
- Find and internally edit DLL.XML, searching for probable XMLTools, XMLVars and LOGGER entries.
- Remove XMLVars entry if found in the code.
- Remove LOGGER entry if found in the code.
- Add XMLTools entry if not present in the code.
- Make a backup of original DLL.XML.
- Update DLL.XML.

All of this made automatically, no user input required.

To run the installer, copy **XMLTools_20_Installer.exe** to any folder and execute it, preferable as Administrator. Besides the on screen log, XMLToolsInstallerLog.txt file is created also in the same folder.

OS supported: Windows Vista and newer versions.
